

# ECCO Version 4: Parameterized And Resolved Processes

Gaël Forget

ECCO Meeting MIT 2016/05/16

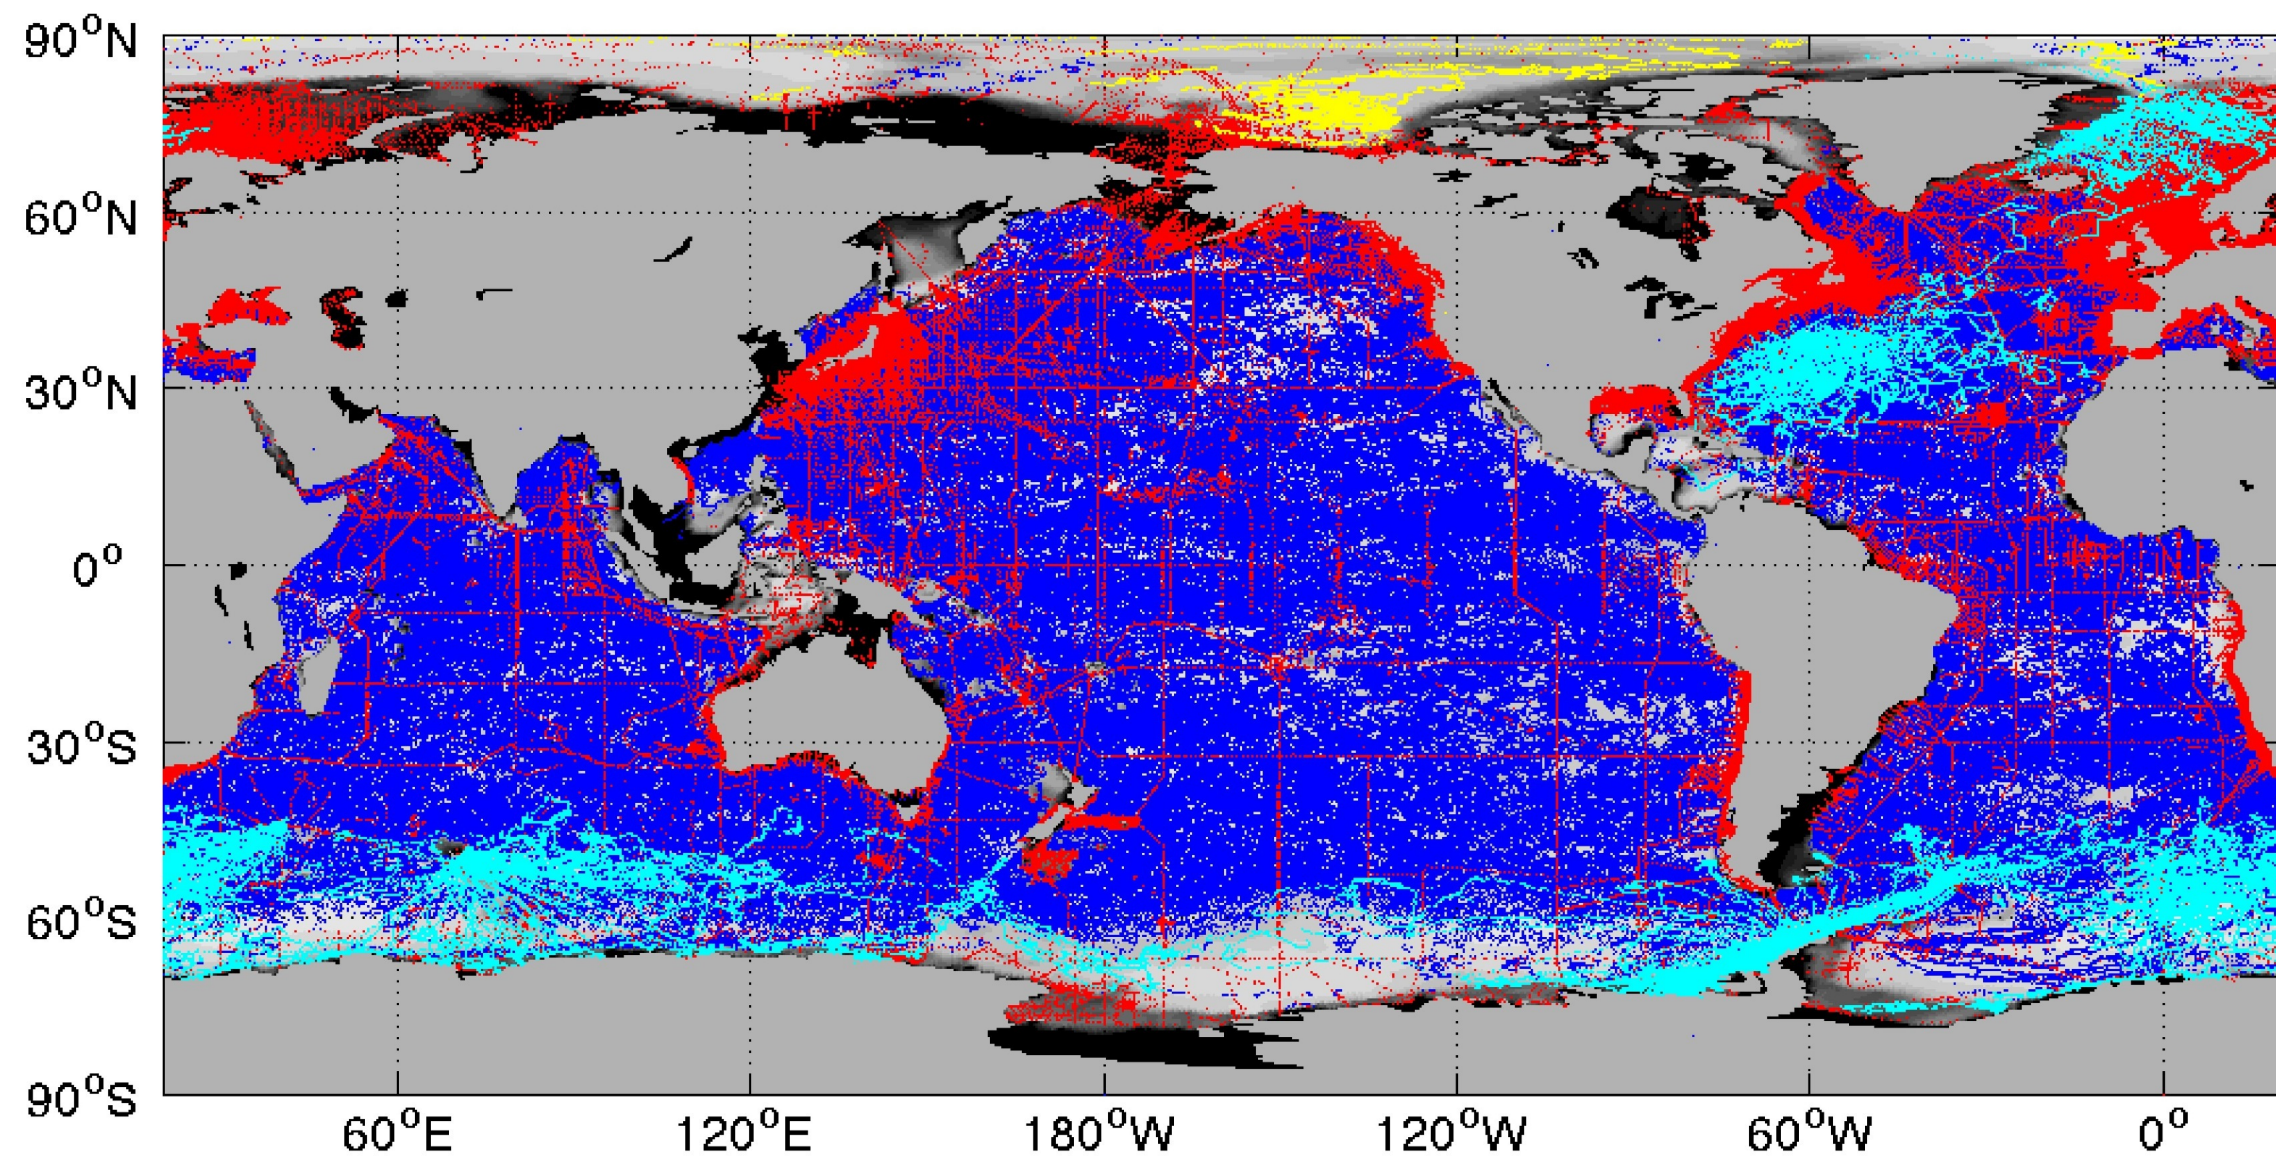

This presentation (which does not address energetics) will consider this problem from complementary point of views

Gaël Forget

In-Situ Data Included  
In ECCO v4-r2

2016 ECCO  
meeting

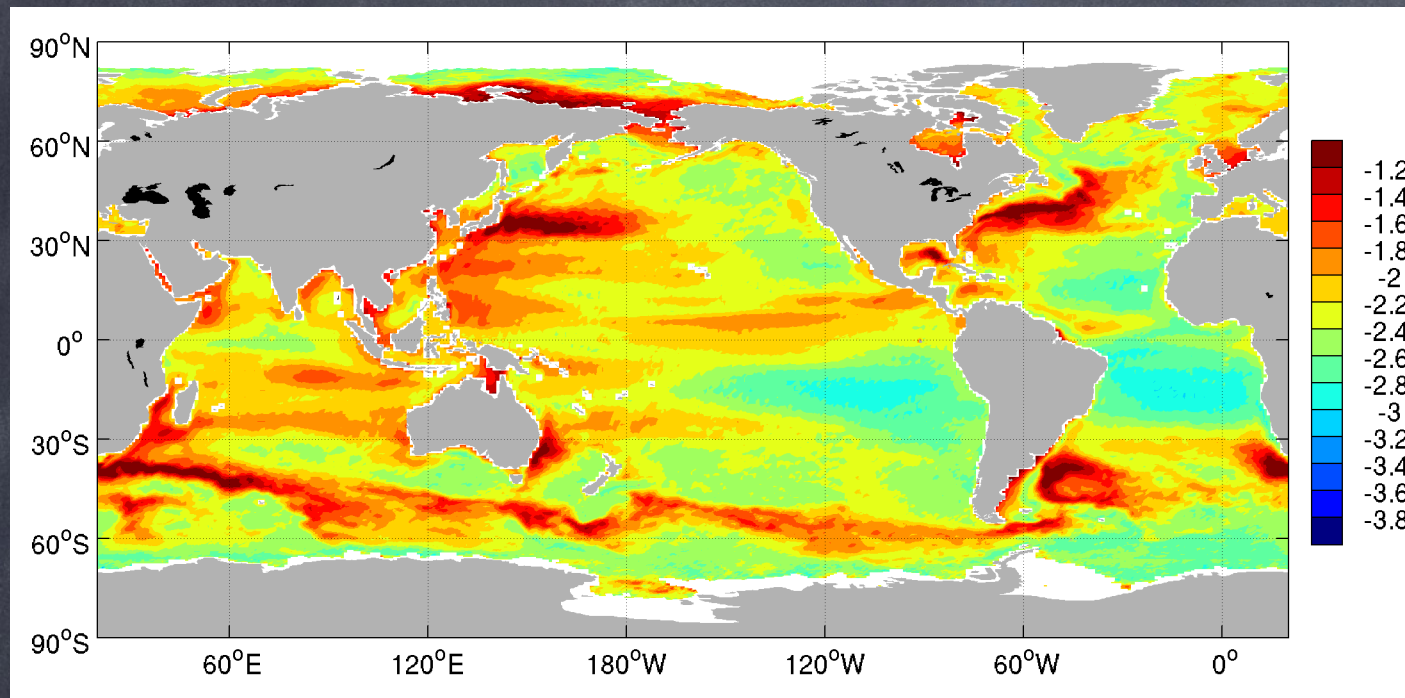

Forget (in prep.)

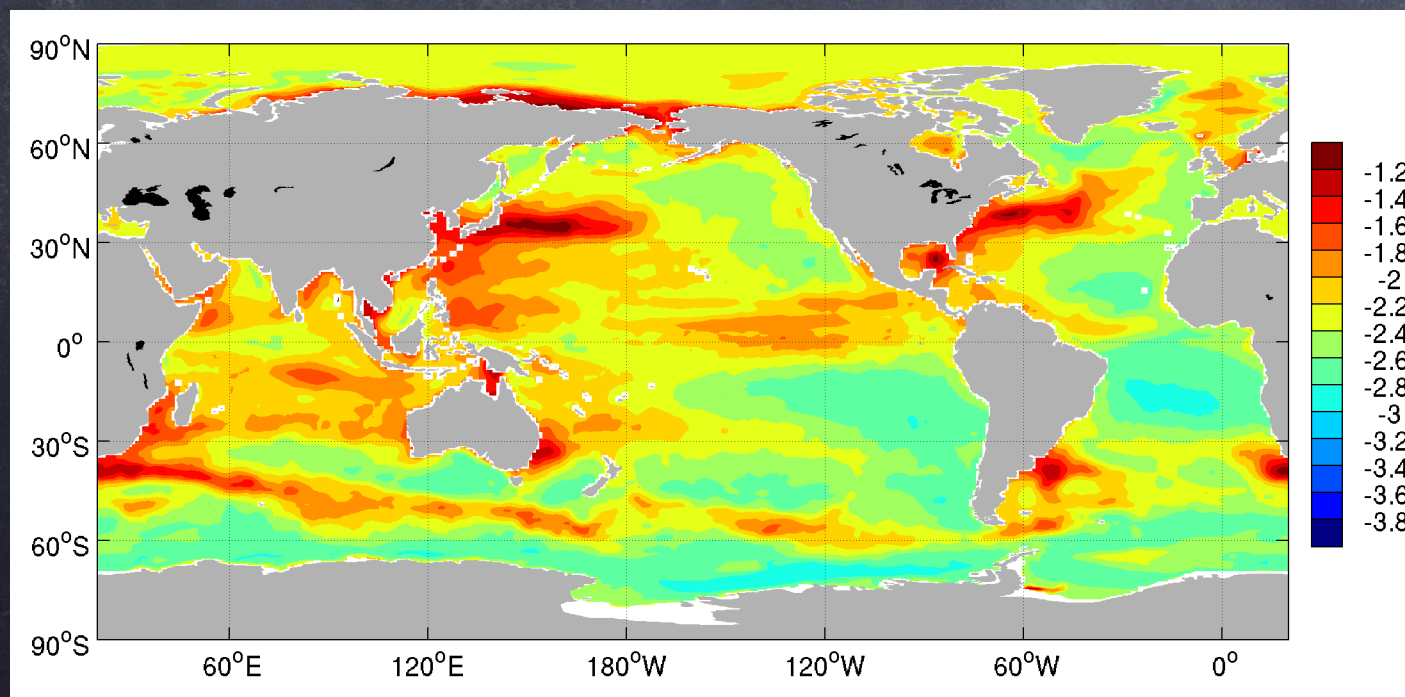

Gaël Forget

## Relating observed Altimetric And In-Situ variability

2016 ECCO  
meeting

**Top:** log10 of **altimetry** variance.  
From bin average RADS data set  
(1 degree, daily).

**Bottom:** same but estimated based  
on **in situ steric height** anomalies  
(profile data - seasonal cycle)  
+ 2.7cm instr. error (FP 2015)  
+ BP variability (ECCO v4-r2)  
+ seasonal cycle (ECCO v4-r2)

Forget (in prep)

# Altimetry And ECCO Frequency Spectra

2016 ECCO  
meeting

Large-Scale

Meso-scale

Forget and Ponte 2015 (PO)

Monthly sea level anomaly over the central Labrador sea in ECCO v4-r2 displayed with 95% misfit interval computed from large-scale model-data misfits (**red shading**) or daily grid-scale model-data misfits (**blue shading**). The black curve is the corresponding altimetric average (large-scale).

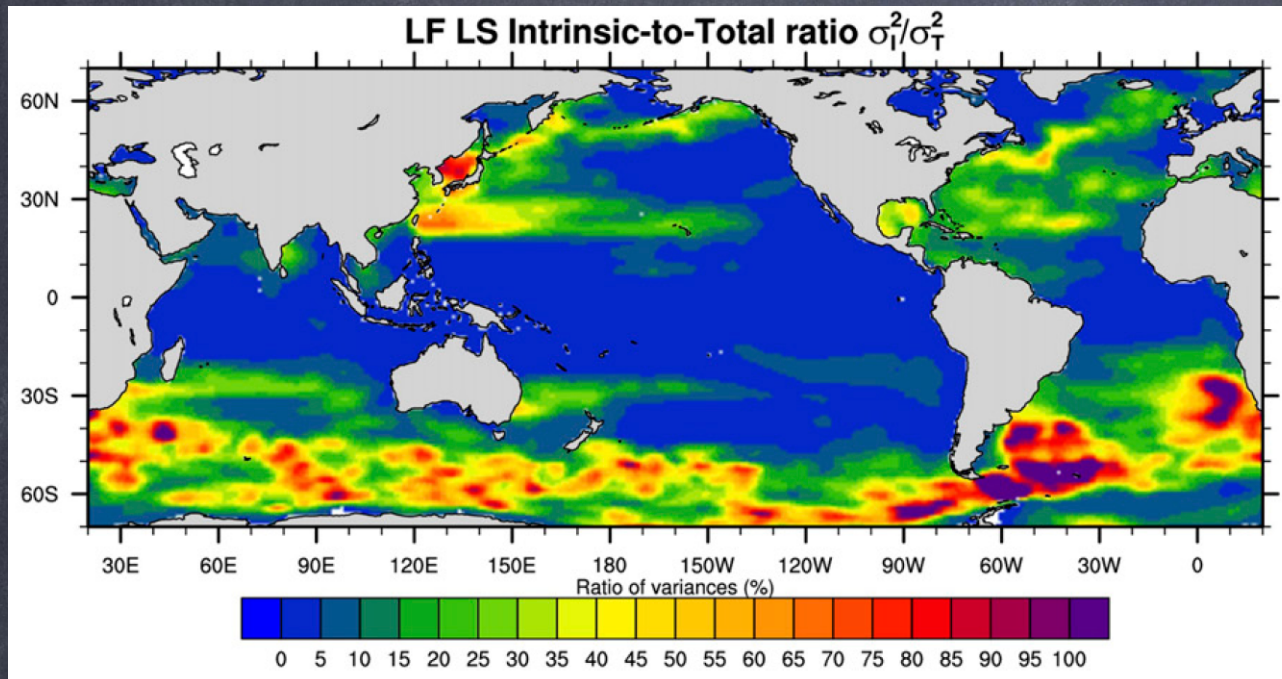

This plot was generated from large-scale and daily grid-scale model-data misfits (Forget and Ponte 2015) available at [ftp://mit.ecco-group.org/ecco\\_for\\_las/version\\_4/release2/nctiles\\_remotesensing/sealevel/](ftp://mit.ecco-group.org/ecco_for_las/version_4/release2/nctiles_remotesensing/sealevel/)

# Forced V. Intrinsic Sea Level Variability

2016 ECCO  
meeting

Fraction of intrinsic large-scale  
SLA variance in 1/12 deg. model.

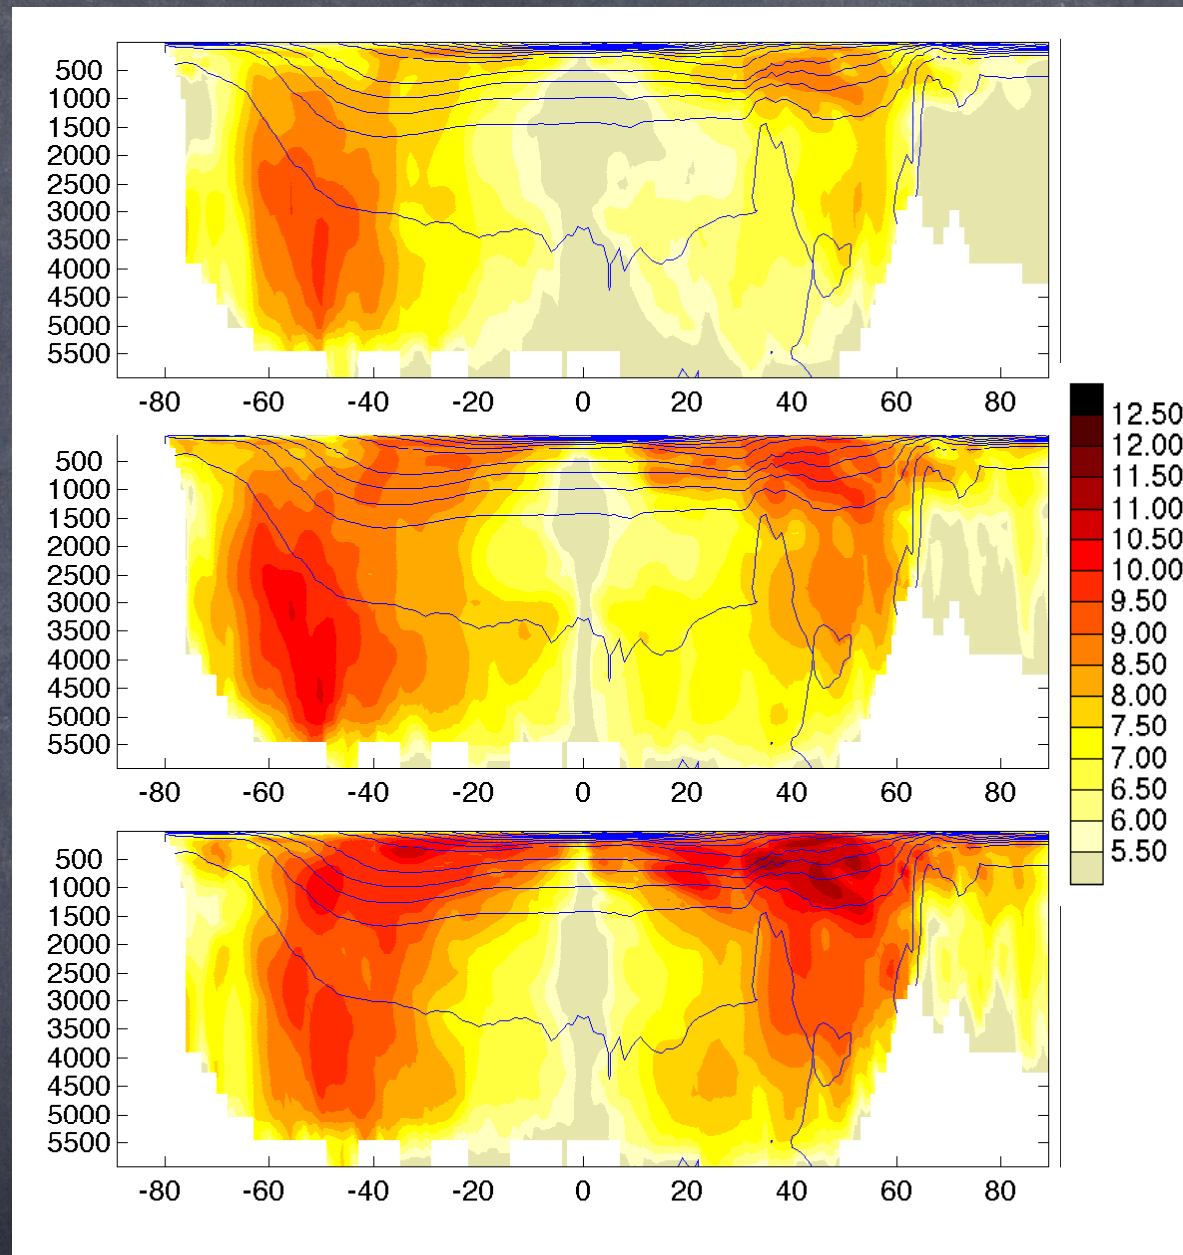

Reproduced From  
Serazin et al 2015

Large Scale SLA cost function

ECCO version 4 release 2  
(<http://hdl.handle.net/1721.1/102062>)

Forget, et al.,  
2015 (OS)

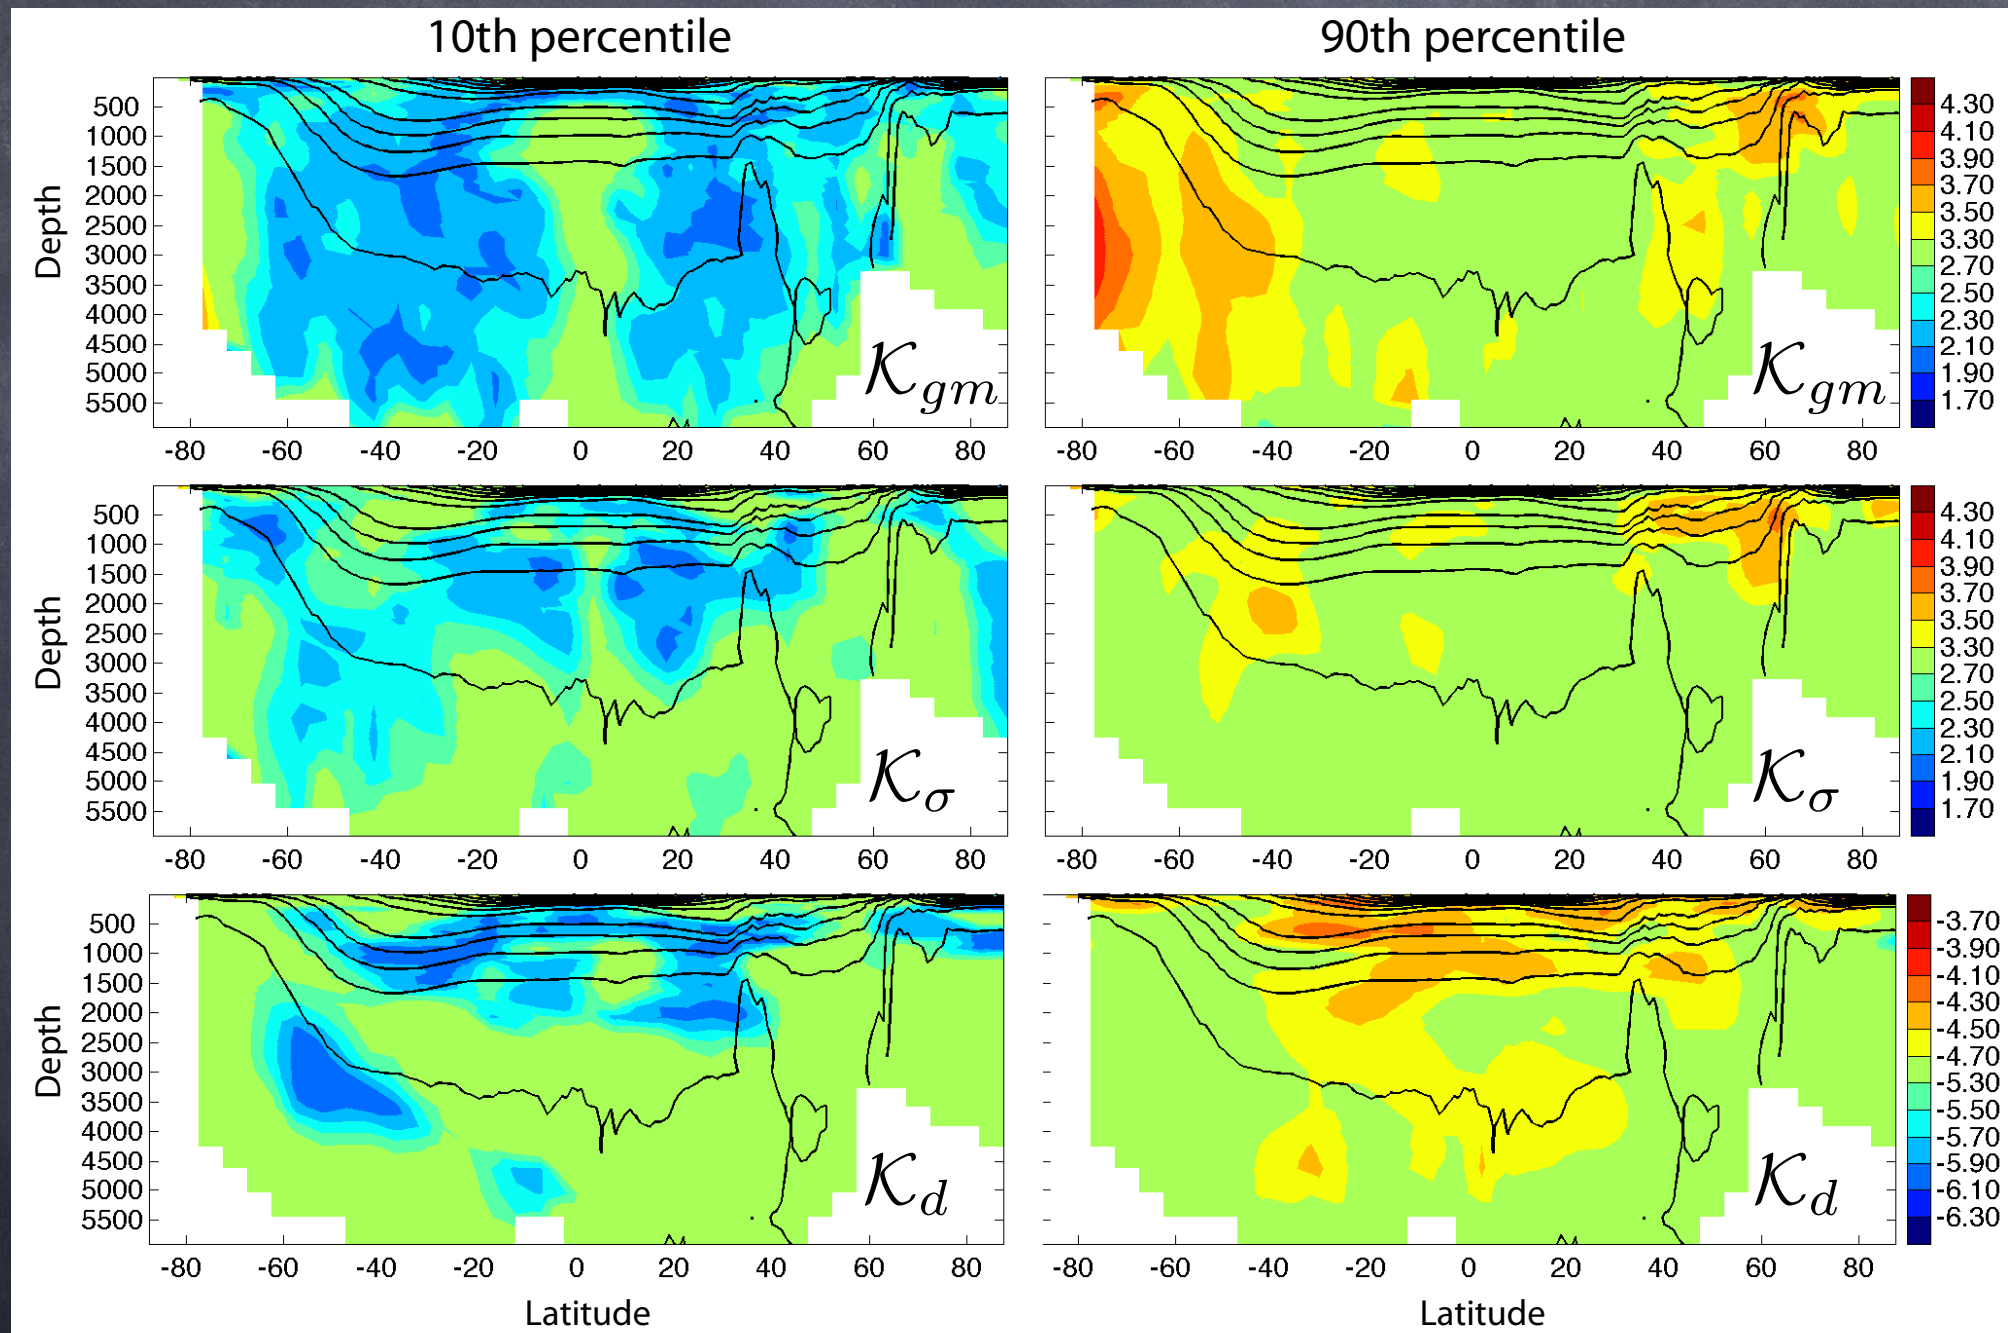

**Figure 5.** Sensitivity to  $\mathcal{K}_{gm}$  associated with 1992–2001 altimetry (top), 1992–2011 altimetry (middle), and Argo T and S profiles (bottom). More than 98% of Argo profiles were collected after 2001. In each case, the squared model–data distance  $J$  is selected accordingly, and  $\frac{\partial J}{\partial \mathcal{K}_{gm}}$  is computed with the adjoint model.

Gaël Forget

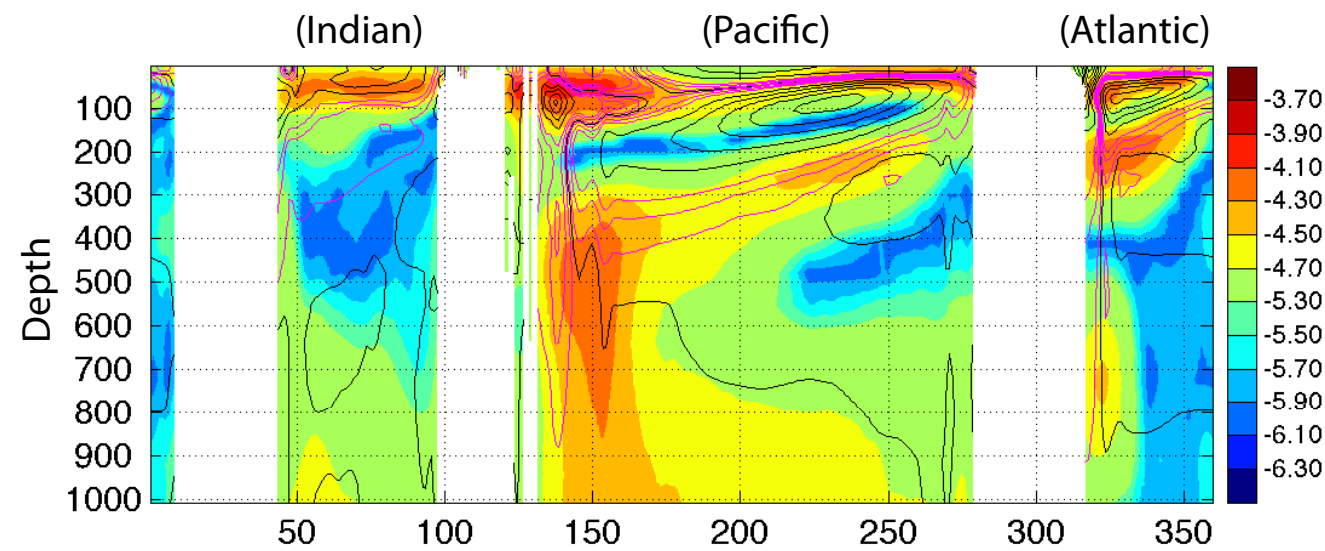

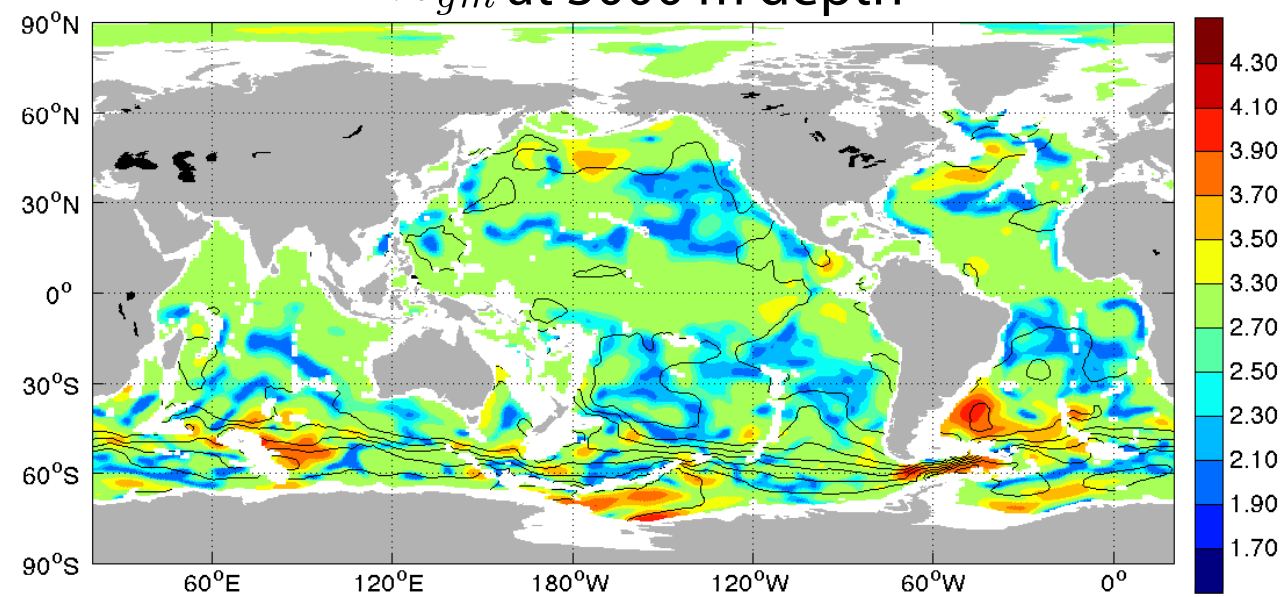

# Estimated Turbulent Transport Parameters

2016 ECCO  
meeting

Forget, Ferreira, Liang 2015 (OS)

$\mathcal{K}_d$  at the equator $\mathcal{K}_{gm}$  at 3000 m depth

# Estimated Variograms And Spectral Slopes

2016 ECCO  
meeting

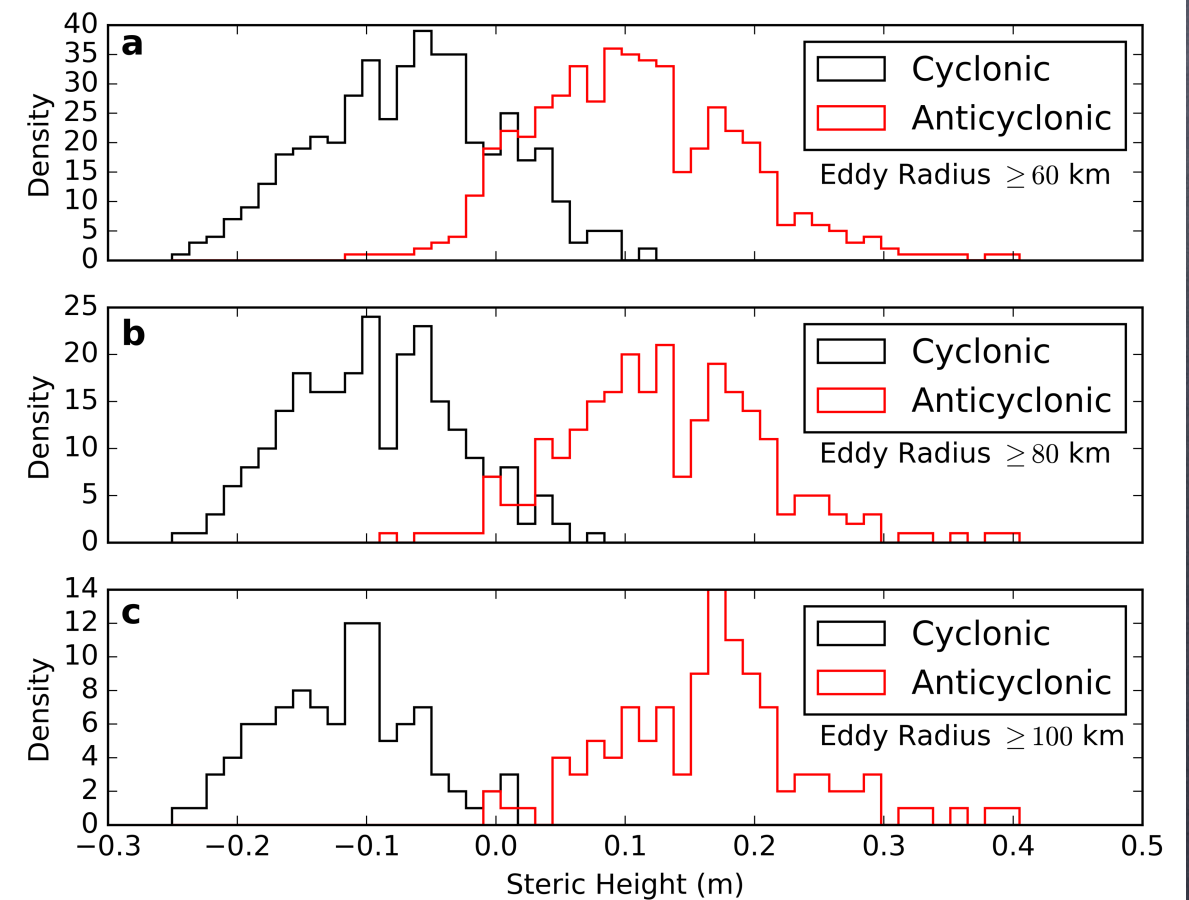

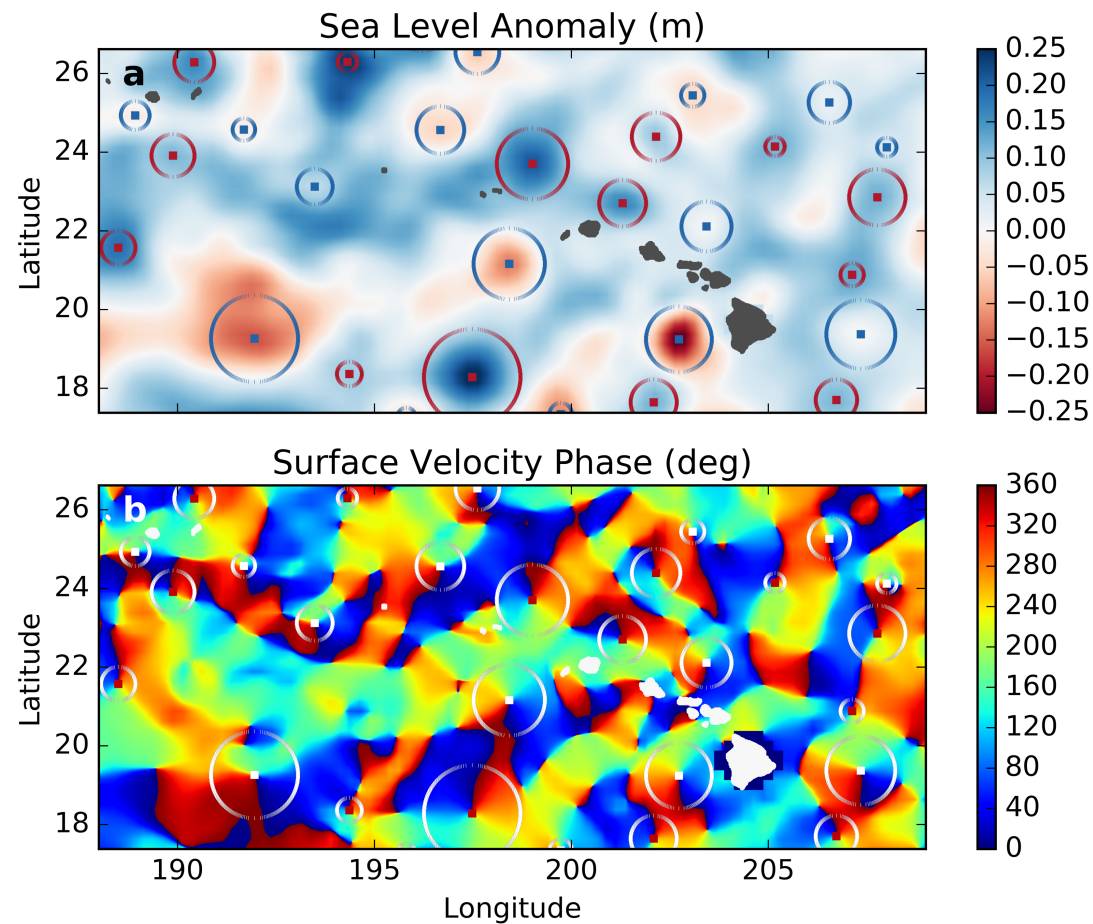

McCaffrey, Fox-Kemper, Forget 2015 (JPO)

Gaël Forget

# Eddy Identification, Tracking, And Statistics

2016 ECCO  
meeting

Ashkezari, Hill, Follett, Forget, and Follows (in prep.)

- **ECCO v4, input data, misfits, and uncertainty fields:** allow users to assess quality of fit and are a useful research tool in their own right. They are included in release 2 (see [ecco-group.org](http://ecco-group.org) and [ecco2016gf1.pdf](#) slides).
- **ECCO v4 can be viewed as an effort to partition large-scale V eddy signals:** subtracting it from the data allow to focus on intrinsic variability – to the extent that large-scale variability is predominantly forced.
- **The estimation of time-mean turbulent transport parameters in ECCO v4:** was essential to an improved fit to in situ data and reduce spurious model drifts. Many question remains even w.r.t. time mean balances. A general question is whether available data may allow for time-variable inversions.
- **Analysis of meso-scale and small-scale variability from observations:** is a very complementary approach to what we do in ECCO – most immediately to refine our understanding of errors but also more generally.
